$17 Million Revenue at Risk!

Executive Summary

We defined "at risk of churning" as clients whose recent flying behavior has materially deviated from their historical travel cadence and/or who exhibit declining engagement or satisfaction signals. Specifically, clients are flagged when their time since last trip significantly exceeds their own historical average between trips, when they have no activity in the last 12 months, or when these behavioral indicators are compounded by negative NPS feedback.

This approach allows us to prioritize high-value clients whose activity patterns suggest elevated churn risk while deploying lighter-touch engagement strategies for moderate-risk segments showing early signs of disengagement.

How We Define "High Risk"

Our model incorporates three primary dimensions: behavioral cadence, recent activity, and client sentiment.

- Time since last trip materially exceeds the client's historical flying cadence (e.g., ≥2x their typical gap between trips),
- and/or no trips in the last 12 months,
- with elevated risk when paired with detractor NPS scores.

Potential Retention Strategies

A) **White-Glove Retention for High-Value, High-Risk Clients**
Prioritize proactive, personalized outreach to clients whose activity has fallen materially below their historical cadence - particularly high spenders and NPS detractors. Assign account ownership and focus on relationship-driven engagement and service recovery to protect revenue at risk.

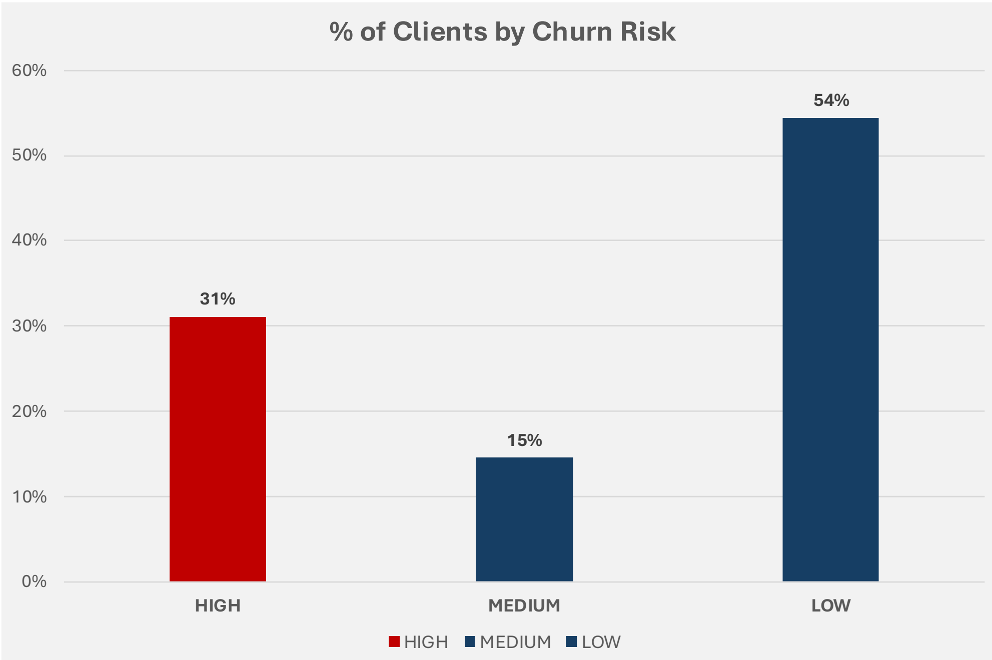
B) **Rapid Intent Follow-Up for Browsing, Non-Booking Clients**
Trigger timely outreach to medium-risk clients showing elevated website activity but no recent bookings. Address potential pricing or availability friction with tailored aircraft options and transparent conversations to convert intent into bookings.

Recommendations

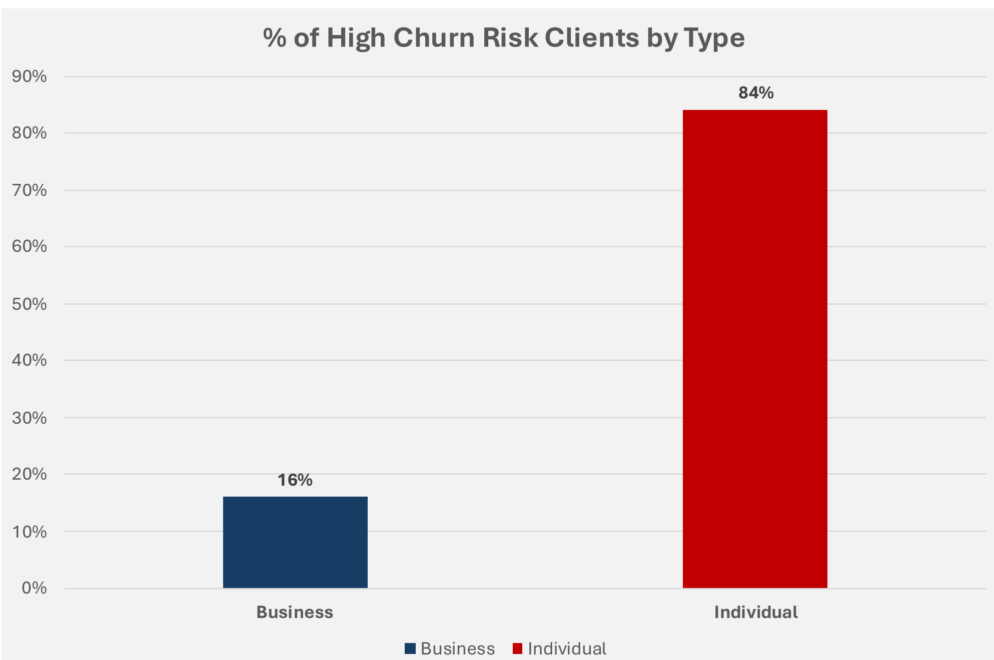
From an analytical standpoint, the next step would be to develop a predictive churn propensity model using historical churn outcomes to statistically weight drivers of attrition. This would allow us to move from rules-based scoring to probability-based risk segmentation and optimize retention investment based on expected revenue at risk.

Appendix

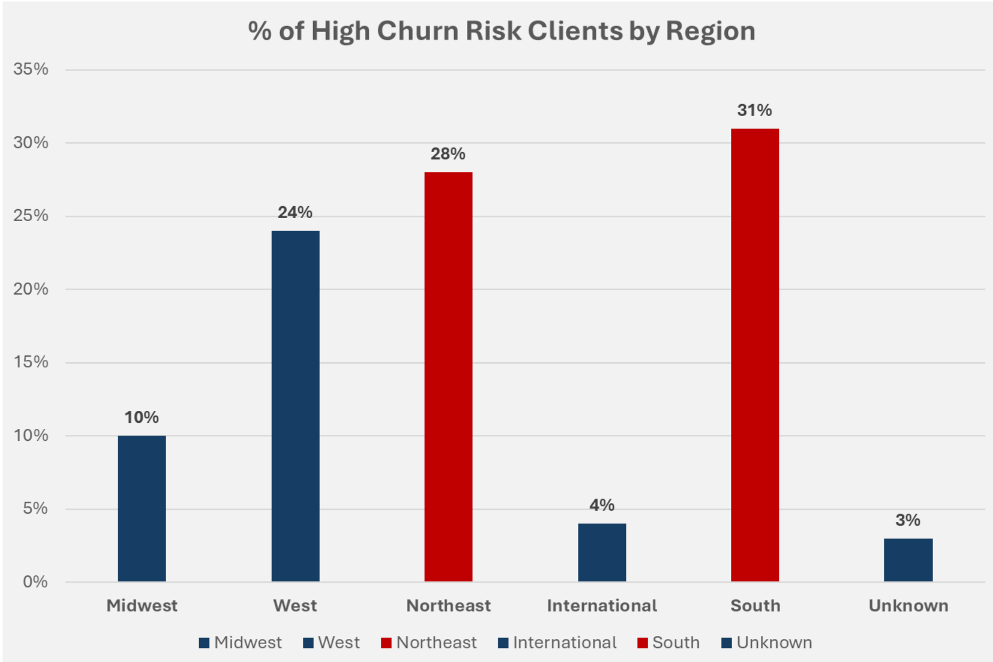
a) More than 50% of clients have low churn risk.



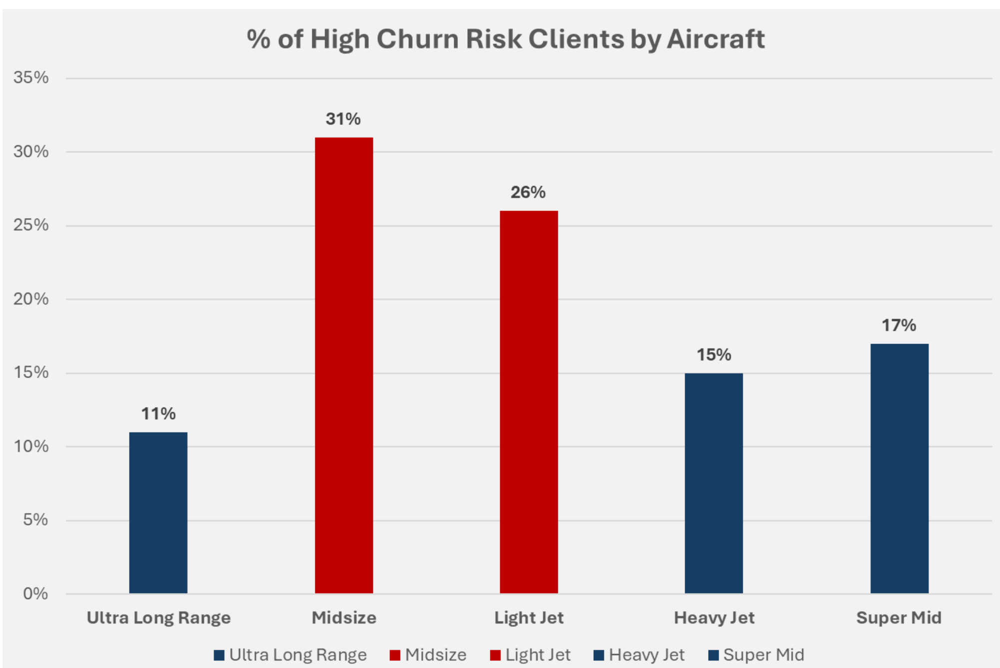
b) Out of the 34% high churn risk clients, 84% of them are "Individual".



c) South and Northeast have the highest number of clients in the high-risk category and should be prioritized for retention efforts



d) Midsize and Light Jet are among the top two preferred aircrafts that carry these high churn risk individuals



e) The company is at high risk of potentially losing $17M in revenue.

Churn Risk	Total Revenue at Risk	# of Clients	Average Annual Spend per Client
High	**$17,056,809**	**298**	**$57,238**
Medium	$5,224,374	139	$37,585
Low	$54,114,556	521	$103,867
